FAQ

I googled "Whole body positive dance fitness" and I found this video on my results page. Without a doubt, the most attractive women in the world are Asian women! - Visible from the photograph: The outline of a head as seen in profile, seen from above and behind. The size of the head can vary considerably but averages about 3.5 to 5.0 inches (8.9 to 12.7 cm) from the top of the crown. Most people's heads are larger than this. Remember, a human head is not a sphere and most of it is not viewed from the side. - In 3D movies, certain depth cues, such as the motion parallax, are missing when the viewpoint is from above or behind the head. Therefore, it is common practice to add some padding to the back, side, or top of the head, to provide a "rear projection" or "side projection" in order to convey the illusion of the head looking back, to the left or right. - In the case of the human head, both the left and right sides of the head are viewed from different angles and are thus affected differently by this lack of depth cues. In general, the left side of the face is easier to recognize than the right side of the face and the left side of the head than the right side of the head. - In the case of a very large head, it is common to add padding to the bottom of the head to provide a "top projection" in order to convey the illusion of the head looking down. This generally results in the head looking up rather than down. - The depth cues provided by the body of the subject are more difficult to control and can distort the overall effect of the photograph. - Long arms are always held at an angle to the body, while longer legs are often held at a straight angle to the body. - When the face is closer to the camera than the eyes, the distance between the eyes and the camera is often exaggerated and the eyes appear larger than they actually are. When the face is closer to the camera than the nose, the nose is often made to appear smaller than it actually is. - If the face is further back from the camera than the eyes, the length of the nose is often made to appear longer than it actually is. A lot of people don't understand why they are seeing double here. Watch the movie again and pay 82157476af
